

**Storm Alarm Suppression**

EOscada supports the following Storm Alarm Suppression features:

- Suppress alarms of any desired alarm class.
- Suppressed alarms are automatically acknowledged and are hidden from the alarm lists until the corresponding alarm classes are unsuppressed.
- Suppressed alarms are recorded in the database and become viewable when the suppression is removed.
- A configurable timeout can be set for each alarm class, after which the suppression automatically ends.
- Alarm classes that are suppressed are identified in the alarm display.
