

## Web Reports

- Web Reports is a web based application that allows the user to bring up a page in a standard web browser that will show graphical trends of historical data.
- The user can choose from a list of previously defined reports by name, or define a new report that is then available to others. The report is generated in the form of a graph of the historical data across the time range selected
- Up to four points can be added to a named report definition. So, for example, a report named LOAD might be configured to show MW and Temperature on the same graph.
- Instructions are provided to configure your web server for login security.
- This tool is delivered as an add-on to your system via CD.
